Effective perfusion requires an optimal interplay between vascular volume and vasomotor tone. In the critical care setting, the blood volume and/or the vasomotor tone may be subject to rapid changes, and a patient may enter the critical care unit with preexisting disturbances resulting from trauma, disease, or pharmacologic treatment.

Use of inotropes in critical care  $CO = HR \times SV$  The SV depends on the SVR (afterload) and the “preload”. Preload (the degree to which ventricles are stretched before contracting) correlates with the end diastolic volume (the volume of blood in a ventricle at the end of filling). It is important to optimise preload by
