Visual memory describes the relationship between perceptual processing and the encoding, storage and retrieval of the resulting neural representations. Visual memory occurs over a broad time range spanning from eye movements to years in order to visually navigate to a previously visited location.

Visual memory - Wikipedia

The majority of research on visual memory has taken a compartmentalized approach, focusing exclusively on memory over shorter or longer durations, that is, visual working memory (VWM) or visual episodic long-term memory (VLTm), respectively. This tutorial provides a review spanning the two areas, with readers in mind who may only be familiar with one or the other.

Visual memory involves the ability to store and retrieve previously experienced visual sensations and perceptions when the stimuli that originally evoked them are no longer present. That is, the person must be capable of making a vivid visual image in his mind of the stimulus, such as a word, and once that stimulus is removed, to be able to visualize or recall this image without help.

This is mostly used for 3D objects that we can visualize and rotate. Also, visual memory does work together with these other two terms. It will combine with spatial and visual form consistency to recall information. It all depends on what you're trying to recall and anything else you may have in your mind.

Visual Memory Advances In Visual Cognition

In visual systems, orientation selectivity is a well-known biological function of the primary visual cortex that is necessary for encoding of visual images (1, 39). In the primary visual cortex, neurons respond preferentially to edges with a particular orientation of input patterns, which is ascribed to the feed-forward filtering function that causes weight enhancement near the preferred ...

Visual memory is one of the basic components of learning. Poor visual memory skills can have a profound effect on every type of academic learning. However, it may also express itself as a problem in one specific area. It all depends on the individual. Visual memory comes in two forms: Short Term Visual Memory - Holding something in mind that we have just seen.

Visual Memory is one part of a large arena known as visual perceptual skills. Visual memory focuses on one’s ability to recall visual information that has been seen. Visual memory is a critical factor in reading and writing. When a child is writing a word, he must recall the formation of parts of the letter from memory.

Neuronal activity in the PFC demonstrates visual short-term memory correlates by exhibiting sustained changes, often elevation, but sometimes suppression, during the retention interval of short-term memory tasks (e.g., Fuster & Alexander, 1971; Miller et al., 1996; Shafi et al., 2007 ). Visual recognition memory is also apparent in the PFC primarily exhibiting match enhancement while some cells exhibit match suppression (e.g., Miller et al., 1996 ).

The Effect of Visual Memory. Women reveal better visual memory in the identification and recognition of human faces, as shown by research into the effect of memory on the psychological perception of the face over different periods of time (5, 10, and 30 min). The ability to remember a face decreases significantly as more time elapses between exhibition of the face and the request to identify and recognize it at a later stage.

The visual and auditory memory literature has traditionally divided memory into separate component systems such as sensory memory and short-term, long-term, and working memory (Cowan, 1995, 2001, 2008; Linden, 2007). Sensory memory refers to the registers for veridical, modality-specific representations that provide the first memories of inputs to each of our senses.
